

ABSTRACT

The method for glossing solid surface by forming a film thereon has the steps of: preparing a film-forming coating liquid containing at least an isocyanate compound having two or more isocyanate groups, a
5 synthetic resin having a functional group which reacts with the isocyanate group, and an organic solvent; coating the film-forming coating liquid onto the solid surface; and film-forming on the solid surface after the step of coating.

The coating weight of the film-forming coating liquid is adjusted
10 in the step of coating so as the film thickness after the step of film-forming to become a range from 0.1 to 5 μm .
